DETAILED ACTION

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with George W. Hertnell on March 24, 2005.

2. **Please amend claims 1 and 14 as follow:**

IN THE CLAIMS

In claim 1, lines 10-11, please delete “ and the sequence of the addressing scan is reversed every one or more display frames”, and replace it with -- and the scanning sequence of a plurality scanning line is reversed every one or more display frames for the addressing scan--.

In claim 14, lines 10-11, please delete “ and the sequence of the addressing scan is reversed every one or more display frames”, and replace it with -- and the scanning sequence of a plurality scanning line is reversed every one or more display frames for the addressing scan--

Allowable Subject Matter

3. Claims 1-20 are allowed.
4. The following is an examiner's statement of reasons for allowance:
5. None of the prior art of the record either singularly or in combination teaches or fairly suggests an image display apparatus, comprising: a display section including picture elements for modulating light transmission or reflection; a driving section for performing an addressing scan of the picture elements in such a manner as to successively change light modulation states of the picture elements in each display frame; and a light emitting section for illuminating the display section, wherein the light emitting section is switched ON-OFF exactly once in each display frame, the addressing scan for the picture elements is performed in the OFF state of the light emitting section in each display frame, and a scanning sequence of a plurality of scanning line is reversed every one or more display frames for the addressing scan.

Cited reference Ge et al. (5,402,243) teach the transmission rate of the LCD therein is proportional to analog input signals. In figs 2 and 10, and 11, display control unit applied pulses each composed of a reset component and a scanning component periodically, including at times t_{n1} , t_{n2} and t_{n3} . These reset and scanning pulses are applied to LCD-by-LCD row controllers as controlled by unit (104). In response to the analog input, LCD column drivers apply three sequential pulses, the transmission rate of a selected pixels addressed by pulses is shown as curve (304). The steady transmission rate in curve is proportional to the amplitude of pulses. In synchronism therewith, EFBL 34 generates red, green and blue pulses of constant width and amplitude during the time period at which the transmission rate of the selected pixel is substantially constant.

However, Ge does not teach the claimed limitation such as "a scanning sequence of a plurality of scanning line is reversed every one or more display frames for the addressing scan".

6. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
